Abstract

The geopolitical region of South East Asia has been influenced by some geopolitical factors including the efforts of Arabian states to form an Arabian military coalescence in the years ending to 2020. These agents have given rise to a plenty of changes increasing tensions and conflicts in the region. The military coalescence outlined under the influence of geopolitical backgrounds in Persian Gulf, posed the questions that how such a coalition can be realized in the near future. This present research, based on neu-realism approach, has addressed the geopolitical factors effective in shaping the coalescence. We have used cross effect analysis techniques and experts opinions to examine the feasibility of forming the military coalescence. The results of this study have indicated that some more powerful interrupting factors can weaken the possibility. To reduce tensions in the region, therefore, the neighboring states have to develop new military and security collaborations to eradicate the war in the region.
